

MicroGoals – Secure Goal Management Backend API

Title: MicroGoals – Secure Goal Management Backend API

Name: J.Rifana Mahashin

Introduction

This project is a backend application developed to manage data using APIs. The system allows users to create, read, update and delete information efficiently.

Project Overview

MicroGoals is a secure backend RESTful API developed using Node.js, Express.js, and MongoDB. It enables users to register, log in, and manage their personal goals through CRUD operations. The system uses JWT authentication and middleware to ensure data security and user-specific access control.

The system includes:

- User Registration & Login
- JWT-based Authentication
- CRUD Operations for Goals
- Protected Routes
- Centralized Error Handling

The main objective is to provide a secure and scalable backend system for digital goal management.

- Runtime: Node.JS
- Framework: Express.js
- Database: MongoDB

PROJECT ARCHITECTURE

MicroGoals – Secure Goal Management Backend API

CONCLUSION :

This project explains the basic concepts of backend development and API creation. The system allows users to perform operations like creating, reading, updating, and deleting data efficiently. Technologies such as Node.js and Express.js are used to build the backend server, while MongoDB is used to store and manage the data. This project helps in understanding how backend applications work and how APIs communicate with the database.
